

GREEN STEEL CARBON FOOTPRINT NEW SURPLUS

Lally Pipe & Tube is proud to be a part of the circular economy as one of the largest and oldest recyclers in the world. We were Green before Green was a thing. In addition to New Mill Secondary tubular products, Lally regularly purchases New Surplus Standard Pipe, Line Pipe, OCTG Tubing, and OCTG Casing deemed obsolete, excess, rusty, secondary, distressed, and from canceled projects located throughout the U.S.A.

We then professionally repurpose these New Surplus tubular products for use in applications such as bollards, casing, columns, culverts, fencing, piling, rollers, sign poles, supports, water well, etc. The owners of these New Surplus materials turn their idle assets into capital, and our customers get recyclable, high-quality, sustainable, money-saving tubulars.

So how much Carbon (CO₂) can be saved with Lally Pipe & Tube's New Secondary, Structural, Surplus, and Limited Service tubular products vs. Newly Manufactured Prime tubular products?

The answer is 1.96983 net tons of CO₂ saved per net ton.

Example:

42,000 pounds of pipe x 1.96983 = 82,733 pounds of CO₂ saved.

or

21.00 net tons of pipe x 1.96983 = 41.3665 net tons of CO₂ saved.

*According to IEA, McKinsey, World Steel Association, and Sustainable Ships.

Need a Carbon Offset Certificate for your order? That's not a problem. We're glad to provide it for you.
